

DuPont™ Tyvek® Pro and Tyvek® Supro Installation Guide – Australia

DuPont™ Tyvek® Pro and Tyvek® Supro are flexible wall underlays designed for use behind cladding systems on timber and steel framed buildings.

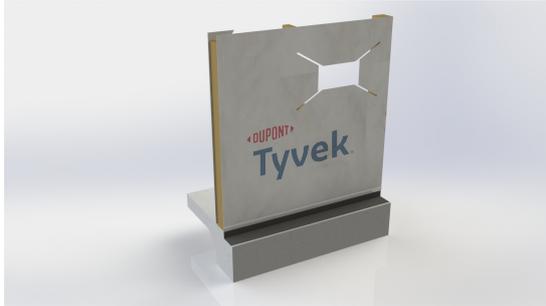

Tyvek® Pro and Tyvek® Supro are fully synthetic polypropylene non-woven laminated to a non-woven high-density polyethylene sheet, manufactured using a spun-bond process and specifically treated to provide high water resistance, high water vapour permeability and high air barrier technical properties.

Tyvek® Pro and Tyvek® Supro have been designed for use as a wall underlay behind cladding systems in residential and commercial timber and steel framed buildings as a means to provide the building with a secondary weather barrier against water ingress and provide air barrier properties to improve effectiveness of bulk insulation. Tyvek® Pro and Tyvek® Supro have high water vapour permeability to assist in managing moisture in the wall cavity.

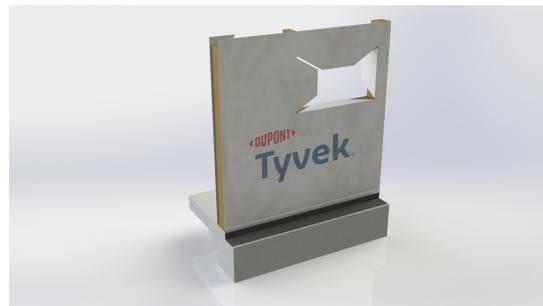

Installation of Tyvek® Pro/Tyvek® Supro must be carried out by competent tradesperson with an understanding of permeable wall sarking installation. Installation must be carried out in accordance to this document and other relevant technical literature as published by DuPont™.

- Always install wall sarking prior to cladding or window installation.
- Ensure that Tyvek® Pro/Tyvek® Supro is pulled taut and fixed to steel or timber framing with galvanised clouts, staples or self-taping screws at maximum 300mm centres.
- Run the product horizontally across the frames, leaving coverage of both the top plate and bottom plate.
- For horizontal laps, ensure there is a minimum of 150mm laps, and for vertical laps, ensure minimum of 150mm lap beyond a full stud span. Always install the underlay in a shingle fashion, ensuring the top layer is always over the lower layer. If vertical laps are taped, lap can be reduced to 50mm.
- Position laps over frame members.
- In a drained cavity situation, where studs are spaced greater than 450mm, support the sarking with polypropylene strapping to prevent the insulation from pushing the Tyvek® Pro/Tyvek® Supro against the back face of the cladding.
- Avoid leaving the wall sarking exposed beyond the cladding or within 100mm of finished ground level to prevent wicking of moisture.
- Repair any rips or tears with DuPont™ Tyvek® Tape.
- Behind masonry brick veneer, ensure that the brick ties are fastened into the face of the studs without ripping or tearing the wall sarking.
- Tyvek® Pro/Tyvek® Supro must not be exposed to the elements beyond 120 days.
- Tyvek® Pro/Tyvek® Supro must be separated from flues, chimneys and fireplaces minimum of 50mm and in accordance with the requirements of BCA for the protection of combustible materials.
- Allow any LOSP (light organic solvent preservative) to flash off for 2 weeks prior to installation of the Tyvek® Pro/Tyvek® Supro.
- Tyvek® Pro and Tyvek® Supro cannot be used as a roof sarking.
- When Tyvek® Pro/Tyvek® Supro is installed in an external wall, the product must be located on the exterior side of the primary insulation layer of wall assemblies that form part of the external envelope of a building. This is to ensure compliance with (i) Clause F8D3 (1) & (2) of NCC2022 Volume 1 and (ii) Clause H4D9, Part 10.8.1 (1) and (2) of NCC2022 Volume 2.
- Optional best practice–
 - When installing window flashing tape; position the wall sarking over openings and cut out window hole at 45° from each corner. Wrap into opening and staple or tape onto inside face of the framing. Finish with DuPont™ Flashing Tape or DuPont™ FlexWrapNF® along the bottom sill and up 200mm each vertical face. Add 300mm vertical and horizontal pieces in both top corners, positioning the flashing tape 150mm horizontal, and 150mm vertical.
 - Tape vertical and horizontal laps with DuPont™ Tyvek® Tape to maintain a good air barrier seal.
 - Seal around all penetrations with DuPont™ Flashing Tape or DuPont silicon or similar compatible tapes.
 - Pre-prime cedar and other timbers claddings prior to installation over Tyvek® Pro/Tyvek® Supro
 - A second layer of Tyvek® Pro/Tyvek® Supro, installed shingle style, can be added above window and door head flashings.

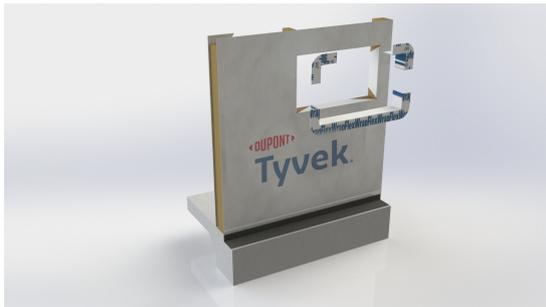

Typical Window Flashing Installation Guide

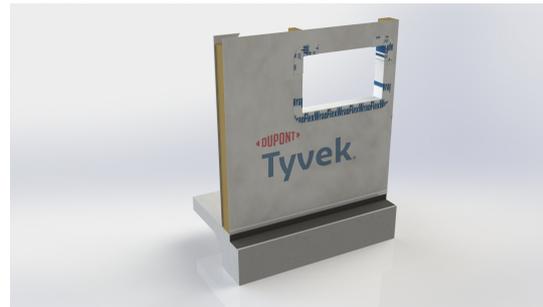

1. Cut the centre out

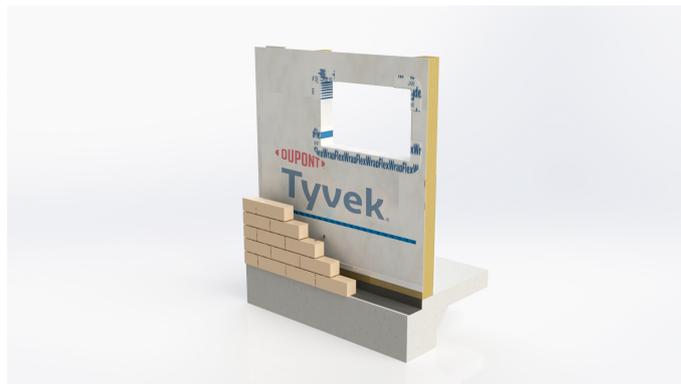

2. Fold in the edges and staple back

3. Cut and install flashing as shown

4. Completed flashing

Typical brick cavity wall assembly.
